Received 14 November 2006

Abstract. Possible existence of exotic molecules consisting of N=4 unit charge particles is investigated using the Rayleigh-Ritz variational method. Several exotic molecules of the form $A^-B^+B^-A^+ (e^-\mu^+e^+, e^-\pi^+\pi^-e^+, \text{and} \mu^-\pi^+\pi^-\mu^+)$ are found to exist as bound states.

PACS number: 36.10.Dr

1 Introduction

The question about the existence of exotic molecules has become very important. Several systems of unit charge particles have been recently studied. The simplest of these systems are the positronium ion ($e^+e^-e^-$) predicted by Wheeler [1] and experimentally observed by Mills [2], the $Ps_2$ molecule ($e^-e^+e^-e^+$) and the $PsH$ system predicted by Hylleraas and Ore [3]. These systems have been extensively studied recently by various theoretical methods [4].

The problem of stability of hydrogen-antihydrogen molecule is of particular interest, since this is the simplest matter-antimatter molecular structure, and may be considered fundamental in a theoretical investigation of the stability of many exotic systems. This problem was treated many years ago by many authors [5–7]. Recently, Richard [8, 9] showed that the stability domain of the systems made up of four particles, two having the same positive charge and two having the opposite negative charge, interacting only through coulombic forces, could be represented in terms of points in the interior, or on the surface, of a regular tetrahedron. Following this idea, Armour et. al. [10] showed that $HH$ lies deeply inside the domain of instability. Gridnev and Greiner [11] have explained the instability of $HH$ through the screening effect of the heavy $p$ ($\bar{p}$), so that the bielectrons see the tightly bound pair ($\bar{p}\bar{p}$) as neutral and the system falls apart.

On the other hand, Abdel-Raouf and Ladik [12] have proved that the binding energy $W$ which binds the atom and antiatom together in the four particle-antiparticle system ($m_1^-, m_2^+, m_1^+, m_2^-$) is a monotonic function of the mass...
ratio \( \sigma \) characterizing the \((m_1, m_2)\) atomic system within the \( \sigma \) interval \([0,1]\), and satisfying the relation

\[
W(0) \leq W(\sigma) \leq W(1) \quad \forall \sigma \in [0,1]
\]

which implies the negativity of \( W(\sigma) \) for all \( \sigma \in [0,1] \) if \( W(1) \) is negative. This in consequence means that the existence of positronium molecule, \( \sigma = 1 \), is sufficient to predict the existence of \( HH \) molecule, \( \sigma = 0 \), and also all similar exotic molecules with \( \sigma \in (0,1) \). Accordingly, systems like \( e^- \mu^+ \mu^- e^+ \), \( e^- \pi^+ \pi^- e^+ \),..., could also exist.

In this work the systems \( e^- \mu^+ \mu^- e^+ \), \( e^- \pi^+ \pi^- e^+ \) and \( \mu^- \pi^+ \pi^- \mu^+ \) are tested. Rayleigh-Ritz variational technique is used to predict upper bounds for the energies of the systems. In Section 2, the theoretical treatment of the four particle systems is discussed and the Rayleigh-Ritz variational method is reviewed. In Section 3, the Hylleraas coordinates for the systems are defined, the wave function is introduced and the integrals of the matrix components are treated. Results are listed in Section 4, and conclusions drawn are summarized in Section 5.

2 Treatment of the Four Particle Systems

A quasimolecular structure consisting of two particles and two antiparticles is governed by the Hamiltonian

\[
H = \sum_{i=1}^{4} \frac{-\hbar^2}{2m_i} \nabla_i^2 + \sum_{i<j}^{4} \frac{q_i q_j}{|\mathbf{r}_i - \mathbf{r}_j|}.
\]

The particles are considered to have unit charge, that is \( |q_i| = 1 \). Using

\[
\nabla_i^2 = \sum_{j \neq i} \left( \nabla_i \frac{\partial}{\partial \mathbf{r}_{ij}} \right) \cdot \mathbf{r}_{ij} + \left( \nabla_i \cdot \mathbf{r}_{ij} \right) \frac{\partial}{\partial \mathbf{r}_{ij}},
\]

where the first of these terms is given by

\[
\sum_{j \neq i} \left( \nabla_i \frac{\partial}{\partial \mathbf{r}_{ij}} \right) \cdot \mathbf{r}_{ij} = \sum_{j \neq i} \frac{\partial^2}{\partial \mathbf{r}_{ij}} + 2 \sum_{j \neq i, k} \cos \theta_{ij,ik} \frac{\partial^2}{\partial \mathbf{r}_{ij} \partial \mathbf{r}_{ik}}
\]

with

\[
\cos \theta_{ij,ik} = \frac{r_{ij}^2 + r_{ik}^2 + r_{jk}^2}{2r_{ij} r_{ik}}
\]
Investigation of the Stability of Some Exotic Four Particle Systems

The Hamiltonian (1) can be written as

\[
H = 4 \sum_{i=1}^{4} \frac{-\hbar^2}{2m_i} \sum_{j \neq i} \left( \frac{\partial^2}{\partial r_{ij}^2} + 2 \frac{\partial}{r_{ij}} \frac{\partial}{\partial r_{ij}} + 2 \sum_{k \neq j} \cos \theta_{ij,ik} \frac{\partial^2}{\partial r_{ij} \partial r_{ik}} \right) + \sum_{i<j} \frac{q_i q_j}{r_{ij}}
\]

(5)

It is well known that there is no closed-form analytical solution to the four-particle eigenvalue problem. Hence, the energy is most accurately obtained by variational minimization of the energy functional \( E[\Psi] \) defined as

\[
E[\Psi] = \frac{\langle \Psi | H | \Psi \rangle}{\langle \Psi | \Psi \rangle}
\]

(6)

with respect to the parameters in the wave function. The Rayleigh-Ritz variational method proved to be suitable in performing these calculations [13]. According to this technique, a trial wave function \( |\psi_n\rangle \) is expanded in Hilbert space of dimension \( n \) in the form

\[
|\psi_n\rangle = \sum_k a_k |\psi_{tk}\rangle,
\]

(7)

so that

\[
\langle \psi_{tk} | \psi_{tk'} \rangle = \delta_{kk'}; \quad k,k' = 1,2,\ldots,n.
\]

(8)

On the other hand, all trial functions \( |\psi_{tk}\rangle \) must be generated from a complete set of basis functions \( |\chi_i\rangle \) which expanding the H-domain of the molecule considered

\[
|\psi_{tk}\rangle = \sum_{i=1}^{n} c_{ki} |\chi_i\rangle.
\]

(9)

Normally, the application of the variational principle will result in a set of secular equations for each state, \( k \), of the system

\[
\sum_{j=1}^{n} c_{kj} [\langle \chi_i | H | \chi_j \rangle - E_{nk} \langle \chi_i | \chi_j \rangle] = 0; \quad i = 1,2,\ldots,n,
\]

(10)

and the eigenenergies are obtained from

\[
det (H_{ij} - E_{nk} S_{ij}) = 0,
\]

(11)

where

\[
H_{ij} = \langle \chi_i | H | \chi_j \rangle,
\]

(12)

and

\[
S_{ij} = \langle \chi_i | \chi_j \rangle.
\]

(13)
E. El-Khateeb

Rayleigh [14] and Ritz [15] proved the relation

\[ E_1 \leq E_n^n; \quad n > 0, \]  \hspace{1cm} (14)

which asserts that the variational ground state energy is an upper bound to the exact one. Moreover, Hylleraas and Undheim [16], proved that the relation

\[ E_k \leq E_n^n; \quad k = 1, 2, ..., n \]  \hspace{1cm} (15)

is satisfied provided that Eq. (7) is fulfilled. Relations (14) and (15) in turn state that all variational \( E_n^n \) are upper bounds to the exact \( |E_k \rangle \)'s.

3 Description of the Method

3.1 The Hylleraas coordinates

The Hylleraas coordinates are natural coordinates for treating the four body systems [17–19]. These coordinates are defined as the following:

\[ s_i = \frac{r_{ia} + r_{ib}}{r_{ab}}; \quad i = 1, 2 \]  \hspace{1cm} (16)

\[ t_i = \frac{r_{ia} - r_{ib}}{r_{ab}}; \quad i = 1, 2 \]  \hspace{1cm} (17)

\[ s_a = \frac{r_{1a} + r_{2a}}{r_{12}}, \quad s_b = \frac{r_{1b} + r_{2b}}{r_{12}} \]  \hspace{1cm} (18)

\[ t_a = \frac{r_{1a} - r_{2a}}{r_{12}}, \quad t_b = \frac{r_{1b} - r_{2b}}{r_{12}} \]  \hspace{1cm} (19)

\[ u = \frac{r_{12}}{r_{ab}}, \quad v = r_{ab} \]  \hspace{1cm} (20)

\[ \cos \theta_{1a,ib} = \frac{s_i^2 + t_i^2 - 2}{s_i^2 - t_i^2}, \]  \hspace{1cm} (21)

where 1 and 2 are the two negatively charged particles, while \( a \) and \( b \) are the two positively charged particles. The Hamiltonian terms of Eq. (5) are given in these coordinates by the following expressions:

\[
\nabla_i^2 = \frac{4}{v^2} \frac{1}{s_i^2 - t_i^2} \left[ \left( s_i^2 - 1 \right) \frac{\partial^2}{\partial s_i^2} + \left( 1 - t_i^2 \right) \frac{\partial^2}{\partial t_i^2} + 2s_i \frac{\partial}{\partial s_i} - 2t_i \frac{\partial}{\partial t_i} \right] \\
- \frac{1}{v^2} \left[ \frac{\partial}{\partial u} + \frac{2}{u} \frac{\partial}{\partial u} + 2 \left( \cos \theta_{12,1a} + \cos \theta_{12,1b} \right) \frac{\partial}{\partial s_i} + 2 \left( \cos \theta_{12,1a} - \cos \theta_{12,1b} \right) \frac{\partial}{\partial t_i} \right]
\]  \hspace{1cm} (22)
Investigation of the Stability of Some Exotic Four Particle Systems

\[
\nabla^2_a = \frac{4}{u^2v^2} s^2_a - t^2_a \left[ (s^2_a - 1) \frac{\partial^2}{\partial s^2_a} + (1 - t^2_a) \frac{\partial^2}{\partial t^2_a} + 2s_a \frac{\partial}{\partial s_a} - 2t_a \frac{\partial}{\partial t_a} \right] \\
- \frac{1}{u^2} \left[ \frac{\partial}{\partial u} + \frac{2}{u} + 2 (\cos \theta_{12,2a} + \cos \theta_{12,2b}) \frac{\partial}{\partial s_a} \right] \frac{\partial}{\partial u} + 2 (\cos \theta_{12,2a} - \cos \theta_{12,2b}) \frac{\partial}{\partial t_a} \right] \frac{\partial}{\partial u} (23)
\]

\[
\nabla^2_b = \frac{4}{u^2v^2} s^2_b - t^2_b \left[ (s^2_b - 1) \frac{\partial^2}{\partial s^2_b} + (1 - t^2_b) \frac{\partial^2}{\partial t^2_b} + 2s_b \frac{\partial}{\partial s_b} - 2t_b \frac{\partial}{\partial t_b} \right] \\
- \left[ \frac{\partial}{\partial v} + \frac{2}{v} + \frac{2}{uv} (\cos \theta_{1a,ab} + \cos \theta_{2a,ab}) \frac{\partial}{\partial s_a} \right] \frac{\partial}{\partial v} + \frac{2}{uv} (\cos \theta_{1a,ab} - \cos \theta_{2a,ab}) \frac{\partial}{\partial t_a} \right] \frac{\partial}{\partial v} (24)
\]

\[
\nabla^2_b = \frac{4}{u^2v^2} s^2_b - t^2_b \left[ (s^2_b - 1) \frac{\partial^2}{\partial s^2_b} + (1 - t^2_b) \frac{\partial^2}{\partial t^2_b} + 2s_b \frac{\partial}{\partial s_b} - 2t_b \frac{\partial}{\partial t_b} \right] \\
- \left[ \frac{\partial}{\partial v} + \frac{2}{v} + \frac{2}{uv} (\cos \theta_{1b,ab} + \cos \theta_{2b,ab}) \frac{\partial}{\partial s_b} \right] \frac{\partial}{\partial v} + \frac{2}{uv} (\cos \theta_{1b,ab} - \cos \theta_{2b,ab}) \frac{\partial}{\partial t_b} \right] \frac{\partial}{\partial v} (25)
\]

\[
V = \frac{2}{v} \left[ \frac{1}{u} + 1 \right] - \frac{4s_1}{s^2_1 - t^2_1} - \frac{4s_2}{s^2_2 - t^2_2} (26)
\]

3.2 Construction of the trial wave function

Since the only practical way to calculate the energy and properties of the four-particle systems is to use variational approach, one needs a (good) wave function which to be able to give accurate results. A suitable correlated wave function is that used by James and Coolidge for \( H_2 \) molecule [19]

\[
|\chi_j\rangle = \left( \frac{m_j^i}{s_1} s_2^{n_j} l_1^{k_j} l_2^{k_j} + \frac{n_j^i}{s_2} m_1^{k_j} l_1^{k_j} l_2^{k_j} \right) e^{-\alpha(s_1 + s_2)_{a}^u} (27)
\]

This function has the advantage of satisfying the symmetric property of the molecule under the exchange of particles and antiparticles. Besides, it has its power in the many variational coefficients which can be adjusted to yield accurate results for diatomic molecules. However, unlike real wave functions, James and Coolidge wave function does not satisfy the correlation cusp condition, while the physical insight about molecular bonding seems to be lost. In addition, for large \( s_1 \) and \( s_2 \), the asymptotic conditions are violated [20]. A
better approach is obtained if the wave function describes all possible ionic behavior besides the covalent characteristics of the molecule [3], while explicitly including a correlation function $f(r_{ab})$ to avoid Born-Oppenheimer approximation for the atom-antiatom systems under consideration. A wave function which can meet these conditions besides satisfying both limits adequately is the following:

$$|\chi_j\rangle = s_1^{m_1}s_2^{m_2}t_1^{j_1}t_2^{j_2}e^{-\alpha(s_1+s_2)}\cosh[\beta(t_1-t_2)]u^p v^q e^{-\gamma v}. \quad (28)$$

3.3 Integrals in $s$, $t$, $u$ and $v$

The volume element of the system is obtained in terms of its relative coordinates, Figure 1, as [21, 22]

$$d\tau = r_{ab}^2 r_{1a}^2 r_{2a}^2 \sin\theta_b \sin\theta_1 \sin\theta_2 dr_{ab} dr_{1a} dr_{2a} d\theta_1 d\theta_2 d\varphi_1 d\varphi_2$$

$$= r_{1a}^2 r_{2a}^2 r_{ab}^2 dr_{1a} dr_{2a} dr_{ab} J(\theta_{1b}, \theta_{2b}, \psi_1, \psi_2)$$

$$\times \sin\theta_1 \sin\theta_2 d\theta_1 d\theta_2 d\varphi_1 d\varphi_2 \quad (29)$$

Considering $r_{ab}$ to be the axis of rotation of the molecule, the volume element can then be written as

$$d\tau = r_{1a} r_{2a} r_{1b} r_{2b} dr_{1a} dr_{2a} dr_{1b} dr_{2b} dr_{ab} \sin\theta_b d\theta_1 d\varphi_1 d\Phi_1 d\Phi_2$$

$$= J(s_1, s_2, t_1, t_2)(s_1^2 - t_1^2)(s_2^2 - t_2^2) v^4 \frac{1}{16} ds_1 ds_2 dt_1 dt_2 dv \sin\theta_1 d\theta_1 d\varphi_1 d\Phi_1 d\Phi_2$$

$$= \frac{1}{64} (s_1^2 - t_1^2)(s_2^2 - t_2^2) v^8 ds_1 ds_2 dt_1 dt_2 dv \sin\theta_1 d\theta_1 d\varphi_1 d\Phi_1 d\Phi_2 \quad (30)$$

46
Investigation of the Stability of Some Exotic Four Particle Systems

Accordingly the integration of any integrand \( f \), which is a function of \((s, t, u, v)\) will be given by

\[
\int f \, d\tau = \frac{1}{64} \int (s_1^2 - t_1^2) \, (s_2^2 - t_2^2) \, ds_1 \, ds_2 \, dt_1 \, dt_2 \, d\Phi_1 \, d\Phi_2 \times \int f(s, t, u, v) \, v^8 \, dv \, \sin \theta_v \, d\theta_v \, d\varphi_v, \quad (31)
\]

where

\[
1 \leq s_i \leq \infty, \quad -1 \leq t_i \leq 1, \quad 0 \leq v \leq \infty \quad 0 \leq \theta_v \leq \pi, \quad 0 \leq \varphi_v \leq 2\pi, \quad 0 \leq \Phi_i \leq 2\pi
\]

The function \( f(s, t, u, v) \) could be \( \psi H \psi \) or \( \psi^2 \), so that the integration of Eq. (31) will have the general form

\[
\frac{1}{64} \int (s_1^2 - t_1^2) \, (s_2^2 - t_2^2) \, g(s, t) \, s_1^{m_1} s_2^{m_2} t_1^{k_1} t_2^{k_2} u^p e^{-\delta(s_1 + s_2)} \times\]

\[
\left\{ \begin{array}{l}
\cosh^2[\beta (t_1 - t_2)] \\
\cosh[\beta (t_1 - t_2)] \sinh[\beta (t_1 - t_2)]
\end{array} \right\} ds_1 \, ds_2 \, dt_1 \, dt_2 \, d\Phi_1 \, d\Phi_2 \times \int e^\eta \, dv \, \sin \theta_v \, d\theta_v \, d\varphi_v, \quad (32)
\]

where

\[
g(s, t) = \left\{ \begin{array}{l}
\frac{1}{s_1^2 - t_1^2} \quad \text{as in } \nabla_i^2 \chi_j \\
1 \quad \text{as in the matrix components of unity}
\end{array} \right. \quad (33)
\]

On using

\[
\cosh x = \frac{1}{2} (e^x + e^{-x}), \quad (34)
\]

\[
\sinh x = \frac{1}{2} (e^x - e^{-x}),
\]

and performing integration over \( v, \theta_v \), and \( \varphi_v \), the integral (32) gives

\[
\frac{\pi}{64} \frac{q!}{\gamma^{q+1}} \left[ I_g(m, n, k, l, p, \delta, 2\beta) \pm I_g(m, n, k, l, p, \delta, -2\beta) \right.
\]

\[
\pm I_g(m, n, k, l, p, \delta, 0) + I_g(m, n, k, l, p, \delta, 0), \quad (35)
\]

where the \( \pm \) stands for \( \cosh^2 \) and \( \cosh \sinh \), respectively, while the integral \( I_g \) is given by

\[
I_g(m, n, k, l, p, \delta, \eta) = \int (s_1^2 - t_1^2) (s_2^2 - t_2^2) g(s, t) s_1^{m_1} s_2^{m_2} t_1^{k_1} t_2^{k_2} u^p e^{-\delta(s_1 + s_2)}
\times\]

\[
e^{\eta (t_1 - t_2)} ds_1 \, ds_2 \, dt_1 \, dt_2 \, d\Phi_1 \, d\Phi_2, \quad (36)
\]

47
where $\eta$ may be positive, negative or zero. Substituting with the form of $g(s, t)$ from Eq. (33) implies the following general integral form

$$I_p(m, n, k, l, \delta, \eta) = \int s_1^{m} s_2^{n} t_1^{k} t_2^{l} e^{-\delta(s_1+s_2)} e^{\eta(t_1-t_2)} ds_1 ds_2 dt_1 dt_2 d\Phi_1 d\Phi_2$$

(37)

In performing this integration, it is necessary to expand the powers of $u$ in terms of other variables since $u$ is not used directly as one of the variables of integration. This is achieved using the notation of James and Coolidge for $u^2$ [19], i.e.

$$u^2 = \frac{1}{4} \left\{ s_1^2 + s_2^2 + t_1^2 + t_2^2 - 2 - 2s_1 s_2 t_1 t_2 - 2 \left[ (s_1^2 - 1) (s_2^2 - 1) (1 - t_1^2) (1 - t_2^2) \right]^{1/2} \cos (\Phi_1 - \Phi_2) \right\}$$

(38)

Besides the Neumann's expansion for $u^{-1}$ [23, 24], i.e.

$$\frac{1}{u} = 2 \sum_{i=0}^{\infty} \sum_{j=0}^{\infty} F_{ij} P_i^j (s \prec) Q_i^j (s \succ) P_i^j (t_1) P_i^j (t_2) \cos [j (\Phi_1 - \Phi_2)]$$

(39)

with

$$F_{ij} = (-1)^j \times 2 (2i + 1) \left[ \frac{(i + j)!}{(i - j)!} \right]^2 ; \quad j \succ 0$$

$$F_{i0} = 2i + 1$$

(40)

where $P_i^j$ and $Q_i^j$ are the associated Legendre functions of the first and second kinds, respectively.

The solution of the integral $I_p$ clearly depends on the value of the index $p$. The details of calculations of $I_p$ at different values of $p$ are given in the Appendix.

4 Calculations and Results

The solution of the integral $I_p$ contains functions which are very sensitive to the computer accumulation error, like the functions $Z_{\mu \tau}^\nu$ and $G_{\mu \tau}^\nu$ appearing in equation (A.19). To overcome this problem extended precision is used and the calculations are made to a large number of significant figures. Besides, the exponential function $e^x$ is evaluated through its Maclaurin expansion with an absolute error

$$\text{error} \bigg|_{i=j} = \frac{x^j / j!}{\sum_{i=0}^{j-1} x^i / i!}$$

(41)
Investigation of the Stability of Some Exotic Four Particle Systems

set to $10^{-30}$. On the other hand, the logarithmic function is evaluated from the Maclaurin expansion of

$$(1 + x)^{15} \ln(1 + x),$$

which gives

$$\ln(1 + x) = (1 + x)^{-15} \left\{ \sum_{i=0}^{15} \frac{a_i x^i}{i!} + \sum_{i=16}^{\infty} \frac{1}{i!} (-1)^i a_{16} (i - 16)! \right\};$$

$$0 < x < 1,$$

and

$$\ln(y) = k \ln(2) + \ln(z); \quad y > 2$$

where

$$y = 2^k \times z.$$ 

The coefficients of expansion, $a_i$, are given in Table 1. They are exact and hand made calculated to avoid any approximation.

</table>

The nonlinear parameters of the wave function, $\alpha$, $\beta$ and $\gamma$, are optimized to improve the correlation between particles in each molecule. Only one parameter is changed in a time to avoid local minima traps. The process is repeated for another parameter keeping those tested to be fixed at their optimum values, until finally all parameters are optimized so that the lowest energy is obtained.

A trial wave function composed of 5, 9, 15...21 terms is used. The ground state energies $E_g$ corresponding to these terms are shown in Table 2 for the systems $e^-\mu^+\mu^-e^+$, $e^-\pi^+\pi^-e^+$, and $\mu^-\pi^+\pi^-\mu^+$. The Table also shows calculations for the $Ps_2$ molecule which are made to test method and program. It can be seen that the result obtained for this molecule is compatible with that of other workers [25, 26].

It is apparent from the Table that $E_g$ converges as the number of the wave function terms increases. The 21st-term considered is a term concerning the correlation between the two positive particles of the system, i.e., $p_j \neq 0$, which seems to adjust the ground state energy of the system.

In Table (3) the resulted ground state energies for each system are listed together with the fraction $x$ of binding below threshold which is defined through the
Table 2. Ground state energies at different wave function terms.

The optimum values of the nonlinear parameters together with the mass ratio $\sigma$ are also given for each system. The Table shows that the fraction $x$ of binding below threshold is an increasing function of $\sigma$

$$x(\sigma) \leq x(1) \quad \text{for } \sigma \leq 1$$

$$E_\text{g} = (1 + x) E_{th}.$$ 

relation

$$E_\text{g} = (1 + x) E_{th}.$$ 

(46)

The optimum values of the nonlinear parameters together with the mass ratio $\sigma$ are also given for each system. The Table shows that the fraction $x$ of binding below threshold is an increasing function of $\sigma$
5 Conclusions

The most important conclusion of this work is the confirmation of the existence of systems under study. This supports the theory of Abdel-Raouf [27] for the existence of exotic molecules. Results show that the fraction x of binding below threshold is an increasing function of $\sigma$.

6 Appendix

The solution of the integral (37) is given below at different powers, $p$, of $u$.

6.1 $p = 0$

Upon integration over the azimuthal angles, the integral (37) for $p = 0$ will be given by

$$I_0(m, n, k, l, \delta, \eta) = 4\pi^2 \int_1^\infty s_1^m e^{-\delta s_1} ds_1 \int_1^\infty s_2^n e^{-\delta s_2} ds_2 \int_{-1}^1 t_1^l e^{\eta t_1} dt_1 \int_{-1}^1 t_2^l e^{-\eta t_2} dt_2$$

$$= 4\pi^2 A_m(1, \delta) A_n(1, \delta) B_k(\eta) B_l(-\eta) \quad (A.1)$$

where the integrations $A$ and $B$ are defined as

$$A_\iota(a, b, \alpha) = \int_a^b \lambda^\iota e^{-\alpha \lambda} d\lambda \quad (A.2)$$

and

$$B_\kappa(\pm \eta) = \int_{-1}^1 \lambda^\kappa e^{\pm \eta \lambda} d\lambda. \quad (A.3)$$

The integral $A$ is solved through integration by parts to yield the relation

$$A_\iota(a, b, \alpha) = \sum_{\mu=0}^{\iota} \frac{\iota!}{(\iota - \mu)! \alpha^{\mu+1}} \left[ -\lambda^{\iota-\mu} e^{-\alpha \lambda} \right]_a^b. \quad (A.4)$$

For $b = \infty$ we then have

$$A_\iota(a, \alpha) = e^{-a\alpha} \sum_{\mu=0}^{\iota} \frac{\iota!}{(\iota - \mu)! \alpha^{\mu+1}} a^{\iota-\mu}. \quad (A.5)$$
E. El-Khateeb

The integral $B$, on the other hand, is solved using series expansion for the exponential function to give

$$B_{\kappa}(\pm \eta) = \begin{cases} 
\frac{2}{\kappa + 1} + \sum_{\nu=1}^{\infty} \frac{2\eta^{2\nu}}{(2\nu)! (\kappa + 2\nu + 1)} & \text{for even } \kappa \\
\pm \sum_{\nu=0}^{\infty} \frac{2\eta^{2\nu+1}}{(2\nu + 1)! (\kappa + 2\nu + 2)} & \text{for odd } \kappa 
\end{cases} \quad (A.6)$$

6.2 $p$ is even

In this case, the expansion of $u^p$ is obtained from the relation

$$u^p = (u^2)^{\nu}; \quad \nu = \frac{p}{2}, \quad (A.7)$$

where $u^2$ is given by the relation (38). Using

$$\cos^r \theta = \left(\frac{1}{2}\right)^r \sum_{\kappa=0}^{r} \frac{r!}{\kappa! (r-\kappa)!} \cos (r-2\kappa) \theta. \quad (A.8)$$

Upon integration over the azimuthal angles, all terms containing the cosine function will vanish except those for which $r = 2k$. Accordingly

$$I_p(m, n, k, \ell, \delta, \eta) = 4\pi^2 \left(\frac{1}{4}\right)^{\nu} \sum_{\rho=0}^{\lambda} \frac{\rho!}{(\rho-\mu)!^2} \sum_{\kappa_1=0}^{\mu} \sum_{\kappa_2=0}^{\kappa_1} \sum_{\kappa_3=0}^{\kappa_2} \sum_{\kappa_4=0}^{\kappa_3} \frac{(-2)^{\kappa_4}}{(\mu-\kappa_2)! \kappa_5!}
\times \left(\prod_{i=1}^{4} \frac{1}{(\kappa_i-\kappa_{i+1})!}\right)^{\nu-\mu/2} \sum_{\xi_1, \xi_2, \xi_3, \xi_4=0}^{4} \frac{4}{(\nu-\mu)!} \left[\prod_{j=1}^{4} \frac{(\nu-\mu)/2)!}{\xi_j! (\nu-\mu-2\xi_j)^!}\right] (-1)^{\nu-\mu-\xi_1-\xi_2+\xi_3+\xi_4}
\times I_0(m+2\nu-2\kappa_1+2\xi_1+\kappa_5, n+2\kappa_1-2\kappa_2+2\xi_2+\kappa_3, k+2\kappa_2-2\kappa_3+2\xi_3+\kappa_5, \ell+2\kappa_3-2\kappa_4+2\xi_4+\kappa_5, \delta, \eta) \quad (A.9)$$

where $\lambda$ is defined by

$$\lambda = \begin{cases} 
\frac{\nu}{2} & \text{for even } \nu \\
\frac{(\nu-1)}{2} & \text{for odd } \nu 
\end{cases} \quad (A.10)$$

while $\mu$ is defined by

$$\mu = \begin{cases} 
2\rho & \text{for even } \nu \\
2\rho+1 & \text{for odd } \nu 
\end{cases} \quad (A.11)$$

and $I_0$ is given by relation (A.1).
Investigation of the Stability of Some Exotic Four Particle Systems

6.3 \( p \) is odd

The expansion of \( u^p \) is obtained from the relation

\[
\begin{align*}
u = \frac{p + 1}{2},

\text{where } u^2 \text{ and } u^{-1} \text{ are given by the relations (38) and (39), respectively. Using the relation}
\end{align*}
\]

\[
\cos^\mu \theta \cos j\theta = \left( \frac{1}{2} \right)^{\mu+1} \sum_{\kappa=0}^{\mu} \frac{\mu!}{\kappa!(\mu-\kappa)!} \left[ \cos(j-\mu+2\kappa)\theta + \cos(j+\mu-2\kappa)\theta \right]
\]

and recall that upon integration over \( \Phi_1 \) and \( \Phi_2 \) all terms containing the cosine function will vanish except those for which the cosine argument is zero, relation (A.12) is written as

\[
\begin{align*}
u = & \left( \frac{1}{2} \right)^2 \left[ (s_1^2 + s_2^2 + t_1^2 + t_2^2 - 2 - 2s_1s_2t_1t_2)^{\nu} \\
& \times \sum_{i=0}^{\infty} F_{i0} P_i(s <) Q_i(s >) P_i(t_1) P_i(t_2) \right] \\
& \times \left[ (s_1^2 - 1)(s_2^2 - 1)(1 - t_1^2)(1 - t_2^2) \right]^{\frac{\mu-r}{2}} \\
& \times \left[ \sum_{\lambda=0}^{\nu} \lambda \left( \nu - r - \lambda \right)! \sum_{i=0}^{\infty} F_{i0} P_i(s <) Q_i(s >) P_i(t_1) P_i(t_2) \right] \\
& \times \left[ \sum_{\lambda=0}^{\nu} \lambda \left( \nu - r - 2\lambda \right)! \sum_{i=0}^{\infty} F_{i0} P_i(s <) Q_i(s >) P_i(t_1) P_i(t_2) \right] \\
& \times \left[ \sum_{\lambda=0}^{\nu} \lambda \left( \nu - r - 2\lambda \right)! \sum_{i=0}^{\infty} F_{i0} P_i(s <) Q_i(s >) P_i(t_1) P_i(t_2) \right] \\
& \times \left[ \sum_{\lambda=0}^{\nu} \lambda \left( \nu - r - 2\lambda \right)! \sum_{i=0}^{\infty} F_{i0} P_i(s <) Q_i(s >) P_i(t_1) P_i(t_2) \right]
\end{align*}
\]

where \( \mu \) is defined by

\[
\mu = \begin{cases} 
\frac{(\nu - r)}{2} - 1 & \text{for even } (\nu - r) \\
\frac{(\nu - r - 1)}{2} & \text{for odd } (\nu - r)
\end{cases}
\]

where the second term in the curly brackets exists only for even \( \nu - r \). Now substituting (A.14) in the integral \( I_\mu \), Eq. (37), and integrating over \( \Phi_1 \) and \( \Phi_2 \)
Again, the last term exists only for \((\nu - \epsilon_1)\) is even, while the integral \(X^\nu_r\) is given by

\[
X^\nu_r (m, n, k, \ell, \delta, \eta) = \int s_1^m s_2^n e^{-\delta(s_1 + s_2)} P^r_{\nu}(s \rightarrow) Q^\nu_{\ell}(s \leftarrow) \times W^{\mu} P^r_{\mu}(t_1) P^r_{\ell}(t_2) e^{\delta(t_1 - t_2)} ds_1 ds_2 dt_1 dt_2
\]

(A.17)

with

\[
W^2 = (s_1^2 - 1) (s_2^2 - 1) (1 - t_1^2) (1 - t_2^2)
\]

(A.18)

The solution of the above integral can be written as

\[
X^\nu_r (m, n, k, \ell, \delta, \eta) = Z^\nu_r (m, n, \delta) G^\nu_{\ell} (k, \eta) G^\nu_{\ell} (-\eta),
\]

(A.19)
Investigation of the Stability of Some Exotic Four Particle Systems

where

$$Z^\mu_{\tau}(m, n, \delta) = \int_1^\infty x_1^m x_2^n e^{-\delta(x_1+x_2)} (x_1^2 - 1)^{\mu/2} (x_2^2 - 1)^{\mu/2}$$

$$\times P_\tau^\mu(x_\prec) Q_\tau^\mu(x_\succ) \, dx_1 \, dx_2$$  \hspace{1cm} (A.20)

and

$$G^\mu_{\tau}(\lambda, \pm \eta) = \int_{-1}^1 (1 - x^2)^{\mu/2} x^\lambda P_\tau^\mu(x) \, e^{\pm \eta x} \, dx.$$  \hspace{1cm} (A.21)

The solution of $G^\mu_{\tau}$ is simple. Using [28]

$$P_\tau^\mu(x) = (1 - x^2)^{\mu/2} \frac{d^\mu P_\tau(x)}{dx^\mu}$$  \hspace{1cm} (A.22)

and

$$P_\tau(x) = \sum_{\beta=0}^\tau p_\tau^\beta x^\beta.$$  \hspace{1cm} (A.23)

We get

$$G^\mu_{\tau}(\lambda, \pm \eta) = \sum_{\beta=0}^\tau \frac{\beta!}{(\beta - \mu)!} p_\tau^\beta$$

$$\times \sum_{\zeta=0}^\mu (-1)^\zeta \frac{\mu!}{\zeta! (\mu - \zeta)!} B_{\lambda+\beta-\mu+2\zeta} (\pm \eta).$$  \hspace{1cm} (A.24)

The Z-integral, on the other hand, is written as

$$Z^\mu_{\tau}(m, n, \delta) = \int_1^\infty x_1^m x_2^n e^{-\delta x_1} Q^\mu_{\tau}(x_1) dx_1 \int_1^\infty x_2^m (x_2^2 - 1)^{\mu/2} e^{-\delta x_2} P^\mu_{\tau}(x_2) dx_2$$

$$+ \int_1^\infty x_2^m (x_2^2 - 1)^{\mu/2} e^{-\delta x_2} Q^\mu_{\tau}(x_2) dx_2 \int_1^\infty x_1^m (x_1^2 - 1)^{\mu/2} e^{-\delta x_1} P^\mu_{\tau}(x_1) dx_1$$

$$= H^\mu_{\tau}(m, n, \delta) + H^\mu_{\tau}(n, m, \delta).$$  \hspace{1cm} (A.25)

where

$$H^\mu_{\tau}(m, n, \delta) = \int_1^\infty x^m (x^2 - 1)^{\mu/2} e^{-\delta x} Q^\mu_{\tau}(x) \, dx$$

$$\times \int_1^\infty y^n (y^2 - 1)^{\mu/2} e^{-\delta y} P^\mu_{\tau}(y) \, dy.$$  \hspace{1cm} (A.26)
The y-integral is solved using the relations (A.22) and (A.23) to give
\[
\sum_{\nu=0}^{\tau} \frac{\nu!}{(\nu - \mu)!} p_{\tau}^{\nu} \sum_{\rho=0}^{\mu} (-1)^{(3\mu - 2\rho)/2} \frac{\mu!^2}{\rho!(\mu - \rho)!} A_{n+\beta-\mu+2\rho}(1, x, \delta), \quad (A.27)
\]
so that the \(H\)-integral will be given by
\[
H_{\tau}^\mu (m, n, \delta) = \sum_{\nu=0}^{\tau} \frac{\nu!}{(\nu - \mu)!} p_{\tau}^{\nu} \sum_{\rho=0}^{\mu} (-1)^{(3\mu - 2\rho)/2} \frac{\mu!^2}{\rho!(\mu - \rho)!} \times
\]
\[
\sum_{\kappa=0}^{n+\beta+2\rho-\mu} \frac{(n + \beta + 2\rho - \mu)!}{(n + \beta + 2\rho - \mu - \kappa)!} \left\{ e^{-\delta} \frac{1}{\delta^{\kappa+1}} F_{\tau}^\mu (m, \delta) - \frac{1}{\delta^{\kappa+1}} F_{\tau}^\mu (m + n + \nu + 2\rho - \mu - \kappa, \delta) \right\}, \quad (A.28)
\]
where
\[
F_{\tau}^\mu (\nu, \delta) = \int_{1}^{\infty} x^\nu (x^2 - 1)^{\mu/2} e^{-\delta x} Q_{\tau}^\mu (x) \, dx. \quad (A.29)
\]
The solution of this integral can be obtained through the recurrence relation
\[
F_{\tau}^\mu (\nu, \delta) = (-1)^{\mu/2} \left[ (\mu - \tau - 1) F_{\tau}^{\mu-1}(\nu, \delta) + (\mu + \tau - 1) F_{\tau-1}^{\mu-1}(\nu, \delta) \right], \quad (A.30)
\]
where
\[
F_{\tau}^0 (\nu, \delta) = F_{\tau} (\nu, \delta) = \int_{1}^{\infty} x^\nu e^{-\delta x} Q_{\tau} (x) \, dx. \quad (A.31)
\]
This is solved using the relation [28]
\[
Q_{\xi} (x) = \frac{1}{2} P_{\xi} (x) \ln \left( \frac{x + 1}{x - 1} \right) + \sum_{\eta=0}^{\xi} q_{\eta} x^{\eta}, \quad (A.32)
\]
so that
\[
F_{\tau}(\nu, \delta) = \frac{1}{2} \sum_{\rho=0}^{\tau} p_{\tau}^{\mu} \lim_{\epsilon \to 0} \int_{1+\epsilon}^{\infty} x^{\nu+\rho} \ln \left( \frac{x + 1}{x - 1} \right) e^{-\delta x} dx
\]
\[
+ \sum_{\eta=0}^{\tau} q_{\eta} \int_{1}^{\infty} x^{\nu+\eta} e^{-\delta x} dx
\]
\[
= \frac{1}{2} \sum_{\rho=0}^{\tau} p_{\tau}^{\mu} F_0(\nu + \rho, \delta) + \sum_{\eta=0}^{\tau} q_{\eta} A_{\nu+\eta}(1, \delta), \quad (A.33)
\]
Investigation of the Stability of Some Exotic Four Particle Systems

where the integral

$$F_0(\lambda, \delta) = \lim_{\epsilon \to 0} \frac{\lambda!}{(\lambda - \kappa)!} \frac{1}{\delta^{\kappa+1}} \left( (1 + \epsilon)^{\lambda - \kappa} e^{-\delta(1+\epsilon)} \ln(2 + \epsilon) - \ln \epsilon \right)$$

is solved through integration by parts to give

$$F_0(\lambda, \delta) = \lim_{\epsilon \to 0} \sum_{\kappa=0}^{\lambda} \frac{\lambda!}{(\lambda - \kappa)!} \frac{1}{\delta^{\kappa+1}} \left( (1 + \epsilon)^{\lambda - \kappa} e^{-\delta(1+\epsilon)} \ln(2 + \epsilon) - \ln \epsilon \right)$$

$$+ (-1)^{\lambda - \kappa - 1} e^{\delta} E_l (-2\delta - \epsilon\delta) + e^{-\delta} E_l (-\epsilon\delta)$$

$$+ \sum_{i=1}^{\lambda - \kappa} \left( \frac{\lambda - \kappa}{l} \right) \left[ (-1)^{\lambda - \kappa - 1} e^{\delta} A_{l-1} (2 + \epsilon, \delta) - e^{-\delta} A_{l-1} (\epsilon, \delta) \right], \quad (A.35)$$

where $E_l(x)$ is the logarithmic integral. Now using (A.5) and passing to the limit we get

$$F_0(\lambda, \delta) = \ln(2\delta + C) A_{\lambda} (1, \delta) - E_l (-2\delta) A_{\lambda} (-1, \delta)$$

$$+ \frac{e^{-\delta}}{\delta} \sum_{\nu=0}^{\lambda} \frac{\lambda!}{\delta^{\nu}} \left\{ \sum_{i=1}^{\nu} \frac{1}{i! (\lambda - \nu - i)!} \right\}$$

$$\times \left[ (-1)^{\lambda - \nu - 1} \sum_{\xi=0}^{\nu-1} \frac{(\xi - 1)!}{l - \xi - 1} \frac{2\xi - \xi - 1}{\delta^{\xi+1}} - \frac{(\nu - 1)!}{\delta^{\nu}} \right], \quad (A.36)$$

where $C = 0.5772156649015328606651209008240$, is the Euler constant.
